No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Polynuclectide sequences AAF74187 - AAF74218 encode proteins AAB80608 - AAB80639, which impart environmental stress resistance. The invention relates to a method for identifying DNA encoding proteins imparting environmental stress resistance. The method comprises inserting cDNA from a library originating in a salt-resistant organism into a host cell, culturing the transformants under conditions in which the untransformed host does not grow well, and selecting for viable clones. The method is useful for obtaining DNA encoding environmental stress resistance can be used in the production of plants resistant to environmental stress, which can be cultivated in unfavourable convironmental stress, which can be cultivated in unfavourable convironments such as deserts, salt damaged ground, cold regions and the oceans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the commence and an amengabezic carbon dioxide concentration. PCR primers AAF74219 and AAF7420 are used in an example illustrating the method of the invention. (Updated on 06-AUG-2003 to correct OS field.) Screening method to obtain DNA encoding environmental stress resistance factor, useful for producing transgenic plants resistant to environmental Claim 65; Page 123-125; 167pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                496
                                                                                                                                                                                                                                                                                                    The present sequence is a DNA encoding spinach S-adenosyl-L-methionine: phosphoetbanolamine N-methyltransferase (PEAMT). The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphocholine, phosphomono-methylethanolamine, choline, phosphocholine, redy are useful for altering the lipid content in plant cells. The polynuclectides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties of a plant. The present invention also relates to methods and compositions comprising PEAMT used for generating transgenic plants with increased nutritional value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

Cometabolisms or fungi, plants, or its fragments (I) can be used as enzymes in the production of fine chemicals or in the metabolism of cocorganisms and carotenoids. [1] also assist in transmembrane transport. The fine chemicals that can be produced include lipids, fatty acids, vitamins, cofactors, enzymes, amino acids, and nucleotide bases.

C. Nucleotide sequences, proteins, vectors and host cells from the present invention can be used: [a] to identify mosses related to Physcomitrella patens.

C. C. in the modulation of TCMRP activity; [d] in evolutionary studies; [c] in the determination of functional TCMRP regions; [f] and in the physcomitrella patens activity and the physcomitrella patens of fine chemicals. AAM44222 to AAM44262 encode the physcomitrella patens TCMRP proteins given in AAB99849 to AAB99889.

CAM444121 to AAM44221 represent nucleotide sequence used in the
Tocopherol and carotenoid metabolism related protein; TCMRP; synthesis; Physcomitrella patens; mose; algae; microorganism; fungus; plant; dentification; genome mapping; modulation; evolutionary study; cellular production; fine chemical; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tocopherol and carotenoid metabolism related protein (TCWRP), used to produce fine chemicals, is isolated from mosses, algae, microorganisms, fungi, plants, or their fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ü

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            916
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              220
     The present sequence is spinach S-adenosyl-L-methionine:phospho-ethanolamine N-methyl-transferase (PEAMT) truncated DNA. The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine choline, phosphocholine, phosphatidylcholine, choline-O-sulphate or glycine betaine. They are useful for altering the lipid content in plant cells. The polymucleotides are also useful for improving the osmociic stress tolerance of a plant and increasing the cryoprotectant properties of a plant. The present invention also relates to methods and compositions comprising PEAMT used for generating transgenic plants with increased nutritional value
                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                          6

The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed at the printed at fire wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)

The present invention relates to oligomuclectide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligomuclectides may be used for analysis of SNRs among barley varieties, identification of particular varieties and genotype-phenotype ransformation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligomucleotide clone DNA sequence featured in the specification. The specification, but was obtained in electronic format directly from WIPO at ttp.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardse OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Barley, single nucleotide polymorphism; SNP; genotype-phenotype analysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA clone originating in barley containing SNP encoding sequence #8324.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single nucleotide polymorphism sites in barley varieties and DNA sequences containing them for analysis and identification of barley varieties and production of barley transformants with desired characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 667 BP; 129 A; 196 C; 176 G; 165 T; 0 U; 1 Other;

The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of inew barley varieties with them snd production of inew barley oligonucleoties with desired properties. The present sequence represents an equence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO standardise OS field)

                                                                                                                                The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgaze) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed as pecification, but was obtained in electronic format directly from WIPO at ftp wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SerleuaspValllePheSerAsnTrpLeuleuMetTyrLeuSerAspGluGluValGlu 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype transformation of specific genes and creation of new varieties by varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published-pct-sequences

The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                              Barley; single nucleotide polymorphism; SNP; genotype-phenotype analysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              564 TTTACACTANGTATTTAAAGNNGGCCATGCCATTGATCAGNAGTGGGAGCTCCTGAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PhenyrthriysAlaPheLysGluCysHisLeuGlnAspGlySerGlyAsnSerTyrGlu
                                                                 DNA clone originating in barley containing SNP encoding sequence #9389.
                                                                                                                                                                                                                                                                                                                                                                                                                             Single nucleotide polymorphism sites in barley varieties and D sequences containing them for analysis and identification of b varieties and production of barley transformants with desired characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 566 BP; 168 A; 140 C; 97 G; 156 T; 0 U; 5 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          he present invention relates to oligonuclectide clones originating in barley (Hordeum vulgare) which contain single nuclectide polymorphisms (SNP). The oligonuclectides may be used for analysis of sNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by varieties with desired properties. The present sequence represents an oligonuclectide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at frp. wipo.int/pub/published-poct-sequences. analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                  The present invention relates-to-obigonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype

                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to oligonucleotide clones originating in barley (Bordenn vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published-pct-sequences. The invention describes a nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to any one of 999 fully defined Arabidopsis thalians sequences (I) as given in specification e.g., 360, 137, 455, 219, 472 nucleotides, etc. or its fragment. (I) is useful as a hybridisation probe to complementary molecules in a cDNA library. (I) is also useful for generating genetically modified and transgenic organisms, usually plant cells and plants. A proten encoded by (I) is useful in screening assays to determine the effect of candidate inhibitors, activators or modifiers of the gene product. The protein is also useful for screening biologically active agents e.g., fungicides and active agents e.g., fungicides and insecticides. A genetically modified cell, comprises transcription regulatory sequences operably linked to a sequence capable of hybridising under stringent conditions to (1) is useful in the study of genetic function and for stringent compounds that may affect the biological function of the gene compounds that may affect the biological function of the gene
Novel Arabidopsis thaliana nucleic acids useful for generating genetically modified transgenic organisms, for screening biologically active agents such as fungicides, insecticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or gene product. This sequence represents an Arabidopsis thalians polynucleotide of the invention.
                                                                                                            SEQ ID NO 776; 44pp; English
                                                                                                               Claim 1;

The present invention relates to oligonucleotide clones originating in barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonucleotides may be used for analysis of SNPs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by varieties with desired properties. The present sequence represents an oligonucleotide clone DNA sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fib. wipo. int.pub/published-pct-sequences. (Updated on 27-OCT-2003 to standardise OS field)

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT: Lalgudi, Raghunath V.

APPLICANT: Sherman, Bradley K.

APPLICANT: Sherman, Bradley K.

APPLICANT: Sherman, Bradley K.

TITLE OF INVENTION: POLYNUCLEOTIDES AND POLYPEPTIDES DERIVED FROM CORN EAR FILE REFRENCE: PL-0017 US

CURRENT APPLICANTION NUMBER: US/09/313,294A

CURRENT FILING DATE: 1999-05-14

NUMBER OF SEQ ID NOS: 7600

SOFTWARE: PERL PROGRAM

SEQ ID NO 6753

LENGTH: 280

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Vector: pCWv.SPORF6; Crown and developmental stages

of spike formation in wheat cultivar Norstar. 4 mRNA

populations were combined before constructing the library.

The first mRNA population is from lone crown sections after

30 days of cold acclimation. The second is from Inc crown

sections after II days of deacclimation (before

deacclimation plants were fully vernalized for 49 days).

The third is from different developmental stages of spike

loaf (dissection required). The last is from different

developmental stages of spike and seed formation after

having merged from the leaf (visible). First strand

synthesis in this library was done in the presence of

methylated dCTP thereby protecting from internal cleavage

with Not!."

 Email: igas ests@cs.usask.ca
This sequence is the direct result of the Base calling software
Phred (default parameters). It is the raw base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [9,441].

//clone lid different sources of RNA from a single genotype.
//clone lid different sources of RNA sunflowers that
//clone lincorporated unique 5' and 3' tags to distinguish each
//clone source of RNA. cDNAs were then pooled, size-fractionated,
//directionally cloned into a custom medium-copy vector and
//cransformations made with four size classes to minimize
//cstains. Detains de ach source of RNA and library
//construction can be obtained at http://cgpdb.ucdavis.edu/

Submitted (17-JUL-2002) Plant Gene Expression Center, 800 Buchanan
Submitted (17-JUL-2002) Plant Gene Expression Center, 800 Buchanan
Street, Albany, Ca 94710, USA
The RIKEN Genomic Sciences Center (GSC) members carried out the
collection and clustering of RAFL cDNAs (RAFL cDNA : 'RIKEN
Arbidopsis Full-Length CDNA'): Seki,M., Narusaka,M., Ishida,J.,
Sacou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai, J.,
Hayashizaki,Y. and Shinozaki,K.
 Annotation is based on the January 2002 version of the Arabidopsis genome submitted to Genhank.

//db_xref="texon:3702"
 The Salk, Stanford, PGEC (SSP) Consortium members constructed and sequenced the pUNI (ORF) clones using the RAFL cDNAs: Yamada,K., Chang,M.,, Chang,C.H., Dale,J.M., Huan,Y.W., Lee,J.M., Quach,H.L., Tang,C.C., Toriumi,M., Wallender,E.K., Wong,C., Wu,H.C., Yu,G., Yuan,S., Bowser,L., Chen,H., Cheuk,R., Jones,T., Parlin,Cheukann,G., Kim,C., Lam,B., Lin,J., Miranda,M., Nguyen,M., Palm,C.J., Shinn,P., Southwick,A., Davis,R.W., Ecker,J.R. and Theologis,A.
 Tanda, K., Chan, M.M., Chang, C.H., Dale, J.M., Deng, J.M., Hsuan, V.W., Yamda, K., Chan, M.M., Chang, C.C., Toriumi, M., Wallender, E.K., Lee, J.M., Quach, H.L., Tang, C.C., Toriumi, M., Wallender, E.K., Wong, C., Wul, H.C., Yu, G., Yuan, S., Bowser, L., Carninci, P., Chen, H., Cheuk, R., Hayashizaki, Y., Ishida, J., Jones, T., Kamiya, A., Karlin-Neumann, G., Kawai, J., Kim, E., Lin, J., Miranda, M., Narusaka, M., Nguyen, M., Palm, C.J., Sakurai, T., Sacou, M., Seki, M., Shinn, P., Southwick, A., Shinozaki, K., Davis, R.,, Bcker, J.R. and
 Yamada, K. (SSP/PCEC) and Seki, M. (RIKEN GSC) contributed equally to this work. Shinozaki, K. (RIKEN GSC) and Theologis, A. (SSP/PGEC) contributed equally to this work as PIs.

 Annotation is based on the January 2002 version of the Arabidopsis genome submitted to GenBank.

Location/Qualifiers
 The Salk, Stanford, PGEC (SSP) Consortium members carried out the sequencing and annotation of the RAFL CDNAs: Yamada,K., Banh,J., Banno,F., Chang,E., Dale,J.M., Goldmith,A.D., Lee,J.M., Gondera,C.S., Quach,H.L., Tang,C.C., Toriumi,M., Nu,H.C., Yamamura,Y., Yu,G., Yu,S., Bowser,L., Chen,H., Cheuk,R., Jones,T., Miranda,M., Nguyen,M., Palm,C.J., Shinn,P., Southwick,A., Davis,R.W., Ecker,J.R. and Theologis,A.
 Buchanan
 Yamada, K. (SSP/PGEC) and Seki, M. (RIKEN GSC) contributed equally this work. Shinozaki, K. (RIKEN GSC) and Theologis, A. (SSP/PGEC) contributed equally to this work as PIs.
 Submitted (19-NOV-2001) Plant Gene Expression Center, 800 Buchans Street, Albany, CA 94710, USA RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL CDNAs (RAFL CDNA; 'RIKEN Arabidopsis Full-Length CDNA'): Seki,M., Narnsaka,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J.,
 /more="This clone is in a modified pBluescript vector (Lambda ZAP) as a Xhol/Sstl insert."
Meyers, M.C., Miranda, M., Narusaka, M., Nguyen, M., Palm, C.J., Sakurai, T., Satou, M., Seki, M., Shinn, P., Southwick, A., Shinozaki, K., Davis, R.W., Ecker, J.R. and Theologis, A. Direct Submission

 Eukaryota, Viidiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, eudicotyledons, core eudicots, coids, eurosida I; Brassicales, Brassicaceae, Arabidopsis.

1 (bases 1 to 1911)
Southwick, A., Karlin-Neumann, G., Nguyen, M., Lam, B., Miranda, M., Caranici, C., Bowser, L., Jones, T., Bahl, J., Caranici, P., Chen, H., Cheuk, R., Chung, M.K., Hayeshizaki, Y., Ishida, J., Kamiya, A., Kawai, J., Kim, C., Lin, J., Liu, S. X., Narusaka, M., Pham, P. K., Shano, H., Sakano, H., Sakurai, T., Sarcu, M., Seki, M., Shinn, P., Yamada, K., Shinozaki, K., Ecker, J., Theologis, A. and Davis, R., Vamada, K., Direct Submission
Submitted (27-MAR-2002) DNA Sequencing and Technology Center,
 The Salk, Stanford, PGEC (SSP) Consortium members carried out the sequencing and annotation of the RAFL cDNAs: Southwick, A., Nguyen, M., Karlin-Neumann, G., Lem, B., Miranda, M., Palm, C.J., Bowser, L., Jones, T., Banh, J., Chen, H., Cheuk, R., Chung, M. K., Kim, C., Lin, J., Liu, S.X., Pham, P. K., Sakano, H., Shinn, P., Yamada, K., Ecker, J., Theologis, A. and Davis, R.W.
 RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL cDNAs (RAFL cDNA; RIKEN Arabidopsis Full-Length CDNA'): Seki,M., Narusaka,M., Ishida,J., Satucu,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K.
 Submitted (27-MAR-2002) DNA Sequencing and Technology Center,
Stanford University, 855 California Avenue, Palo Alto, CA 94304,

 During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., pirced quality >= 30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a XAC.

 0; Gaps
consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 factors. The DNA encoding proteins conferring environmental stress resistance, can be used in the production of plants resistant to environmental stress, which can be cultivated in unfavourable environments stress, which can be cultivated in unfavourable environments such as deserts, salt damaged ground, cold regions and the oceans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the effects of the increase in atmospheric carbon dioxide connectration. PCR primers AAP14219 and AAP1420 are used in an example illustrating the method of the invention. (Updated on 06-AUG-2003 to correct OS field.)

New plant S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase polypeptides, useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine and for altering the lipid content in
 The present sequence is a DNA encoding spinach S-adenosyl-L-methionine: phosphoethanolemine N-methyltransferase (PEAMT). The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphocholine, phosphocholine, choline, choline, obtaine. They are useful for altering the lipid content in plant cells. The polynucleotides are also useful for improving the osmortic stress to permane of a plant and increasing the cryoprotectant properties of a plant, and increasing the cryoprotectant properties of a plant, and used for generating transgenic plants with increased nutritions value.

 New plant S-adenosyl-L-methionine:phosphoethanolamine N-methyltransferase polypeptides, useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine and for altering the lipid content in plants cells
 The present sequence is spinach S-adenosyl-L-methionine:phospho-ethanolamine N-methyltransferase (PEAMT) truncated DNA. The PEAMT sequences are useful for modulating the levels of cellular intermediates such as phosphodimethylethanolamine, phosphomono-methylethanolamine, choline, phosphotholine, phosphatidylcholine, phosphatidylcholine, choline-O-sulphate or glycine betaine. They are useful for altering the light content in plant cells. The polymucleotides are also useful for improving the osmotic stress tolerance of a plant and increasing the cryoprotectant properties of a plant. The present invention also relates to methods and compositions comprising PEAMT used for generating transgenic plants with increased nutritional value

(HUMA-) HUMAN GENOME SCI INC

Ruben SM; Rosen CA, Barash SC, WPI; 2001-483426/52. P-PSDB; AAM83959.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

AAX54951 to AAK64702 encode the human immune/haematopoietic antigen (I) Claim 1; SEQ ID NO 1800; 3071pp + Sequence Lieting; English:

Ŋ

```
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vacche production. (I) proteins and can be used in gene therapy and vacche production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of disease associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the protein. (I) proteins and polynucleotides may be used to prevent, dagnose and treat immune/haematopoietic-related diseases, especially conceins and cancer metastesses of haematopoietic derived cells. AAK67703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54922 to AAK54569 and AAM82169 cepresent sequences used in the exemplification of the present invention

The invention describes a nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to any one of 999 fully defined Arabidopsis thaliana sequences (I) as given in specification e.g., 360, 1137, 455, 219, 472 nucleotides, etc., or its fragment. (I) is useful as a law oueful for generating genetically modified and transgenic organisms, usually plant cells and plants. A proten encoded by (I) is useful in screening assays to determine the effect of candidate inhibitors.

CC activators or modifiers of the gene product. The protein is also useful for screening phologically active agents e.g., fungicides and insecticides. A genetically modified cell, comprising an exogenous nucleic acid comprises transcription regulatory contents operably linked to a sequence capable of hybridising under stringent conditions to (1) is useful in the study of genetic function and regulations of the cellular metabolism and for screening compounds that may affect the biological function of the gene core product. This sequence represents an Arabidopsis thaliana

 ABG17575 to ABG20506 represent isolated polymucleotide (I) sequences, and ABB54446 to ABF3472 represent protein (II) sequences, from the present invention. (I) and (II) have cytostatic activity and can be used in gene therapy and vaccines. (I), (II), antibodies and compositions be used in gene present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They can also be useful in vixology, immunology, microbiology, molecular biology and recombinant DNA techniques N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
New immunogenic polynucleotides or polypeptides useful for diagnosing, preventing and treating cancer expressing CT or CP mRNA antigens, and in virology, immunology, microbiology, molecular biology and recombinant DNA techniques.

 AAK54951 to AAK64702 encode the human immune/haematopoletic antigen [1] amino acid sequences given in AAM82170 to AAM91921. [1] have cytostatic activity, and can be used in gene therapy and vaccine production. [1] proteins and polyuncleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate [1] expression. For exemple, they may be used to cteat disorders associated with decreased expression by rectifying mutations or dalations in a parient's genome corpression by rectifying mutations or dalations in a parient's genome corpression by rectifying mutations of [1]. Additionally, [1] polymucleotides may be used to product the secreted [1], by inserting the colymucleotides may be used to provent, and polymucleotides may be used to provent, diagnose and treat immune/haematopoietic-related diseases, especially conceins and cancer amena. Phaematopoietic-related diseases, especially conceins and the man immune/haematopoietic-related diseases, especially concerned and cancer amerateses of haematopoietic-related diseases, especially concerned from the present human immune/haematopoietic antigen genomic sequences from the present invention. AAK84991 to AAK87891 and AAM82169 represent invention.
 Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM

WPI; 2001-488783/53. P-PSDB; AAU16151.

New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 1; SEQ ID NO 317; 980pp; English

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cast, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a allaviating symptoms associated with the disorders and in diagnostic pathological condition. Antibodies to the proteins can also be used in allaviating symptoms associated with the disorders and in diagnostic immunoassays or argin linked immunosorbant assays (ELISA). Disorders within are diagnosed or treated include autoimmune diseases e.g. radiofumunoassays or treated include autoimmune concept the breast or liver, cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. corneal infections and many other disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and callar disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to suburn, to maintain organs before to prevent skin aging due to sunburn, to maintain organs before crease and inchemotraxis. The polypeptides can also be used compensed in sissues and inchemotraxis. The polypeptides can also be used capabilities, fat content, lipid, protein, carbohydrate, vitamins, mirrals, cockcrors and other nutritional components. The present merentals, content, lipid, protein, carbohydrate, vitamins, sequence encodes a novel secreted protein part of the printed escence or the printed sequence data for this patent did not form part of the printed.

The invention relates to human novel polypeptides and their associated polymucleotides. The polypeptides and polymucleotides are useful in gene theretoy for tracting, inhibiting or preventing neural disorders, immune system disorders (e.g. system disorders, respiratory diseases (e.g. nasal polype and sinusitis), reproductive disorders and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal vestbullists, nasal polyps and sinusitis), reproductive disorders (e.g. congenital heart defects, Bastein's anomaly and hypoplastic left reart syndrome), renal disorders (e.g. anomaly and hypoplastic left renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leuxaemia), inflammatory diseases (e.g. septic shock, bursitis and plandictis), allegic reactions and conditions (e.g. asthms), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences Abx73173-Abx74167 represent human novel polymucleotides of the invention
 New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or renal disorders.

arkers for determining the sensitivity of a cancer cell to the anticancer agent TAXOL. Cancer cells can be treated with TAXOL when they care shown to express one of the 804 resistance markers or the cells are shown not to express one of the 804 resistance markers or the methods can be used to determine the effectiveness of TAXOL in the treatment of a cancer cell growth in an individual. The markers can be used as targets in developing anti-cancer agents such as chemotherapeutic compounds. The markers can also be used as targets in developing reatments for cancer. The particularly those cancers which display resistance to agents and exhibit expression of the markers. The anticancer agents developed by the novel cancer bathod can be used to treat cancer. Probes based on the markers can be markers, in the identification of cells or tissues which may be targeted include carcinoma (e.g. squamous corteinoma) sarcoma (e.g. fibrosarcoma) leukaemia (e.g. lymphocytic lateames and tumours (e.g. glioma). The present sequence is one of the
 Novel nucleic acid, used as a marker to determine the effectiveness of using TAXOL to treat cancer cell growth in individuals.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
 The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producting a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal disgnosis of human genetic disorders
 Probe #5803 used to measure gene expression in human placenta sample.

 agent comprising determining the expression of a rat toxic response agene(s) in the test animal in response to the agent. The method is useful in drug development, particularly for conducting toxicity studies and analysis before a new drug or compound is approved for human consumption or use. The method is also useful in determining toxicological responses to a new drug. This polynucleotide sequence represents a phase-1 rat CT gene of the invention
 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but, was obtained in-electronic-format-directly from WIPO at fip.wipo.int/pub/published_pct_sequences

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are usefull for predicting, disgnosing, grading, staging, the monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
